

AI & INTERVIEWING

In the interview context, AI tools can:

- Analyze job postings
- Generate practice questions
- Evaluate your responses
- Even help you rehearse!

But AI isn't a crystal ball. It supports you—it doesn't replace your preparation or your personal judgment.

Ways AI can assist you before the interview:

- Analyze job descriptions to find keywords and tailor your resume or responses
- Generate practice questions based on the role and industry
- Help you structure STAR responses for behavioral questions
- Provide feedback on tone, clarity, and confidence
- Simulate mock interviews using AI-powered platforms

Tools You Can Try

- ChatGPT – Ask it to generate role-specific interview questions or simulate a mock interview
- Interview Warmup by Google – Practice responses and get instant feedback
- Yoodli – Provides real-time coaching on filler words, pacing, and eye contact (via video)

Sample Prompts to Use

- “Give me 5 behavioral interview questions for a Marketing Manager role.”
- “Based on this job posting, what questions should I prepare for?” (*Paste the job posting*)
- “Based on the job posting (*paste job posting*), prepare interview questions that align with my resume (*upload resume*)”

Best Practices

- Use it to brainstorm, not memorize
- Always customize your responses—AI can start the draft, but your real stories matter
- Fact-check any advice it gives you
- Practice, but don't rely solely on AI—also rehearse with real people

What AI Can't Do

- AI cannot read the room.
- It cannot gauge chemistry, personality fit, or cultural nuances.
- It doesn't know your actual experience unless you tell it.

Final Tip

Stay human. Employers hire *people*, not perfect scripts
